Relook at India-US Nuclear Deal

What is the issue?

\n\n

\n
- It's been nearly a decade since the memoranda of understanding on India-US civil nuclear deal was inked.
\n
- It calls for a reassessment of the deal in the context of the newly emerged global realities over the years.
\n

\n\n

What is the deal on?

\n\n

\n
- The U.S.–India Civil Nuclear Agreement or Indo-US nuclear deal or the 123 Agreement was signed between US and India in 2005.
\n
- Under the agreement, India agreed to separate its civilian and military nuclear activities.
\n
- It also agreed to open up the civilian part to inspection by the International Atomic Energy Agency (IAEA).
\n
- In return, the US offered to resume full nuclear trade i.e selling of reactors, Transfer of Technology, Uranium sale with India.
\n
- The deal went through several complex stages including:\n
    \n
    i. amendment of U.S. domestic law (Atomic Energy Act of 1954)
    \n
    ii. civil-military nuclear Separation Plan in India
    \n
    iii. India-IAEA safeguards agreement
    \n
\n
\n

- Around 3 years ago, during the then U.S. President Obama's visit, India-U.S. civil nuclear deal was announced.
  \n
- This finalised the agreement between India and the U.S. on supplier liability and tracking requirements.
  \n
- It enabled American companies to build nuclear power reactors in India.
  \n
- In 2016, during Indian PM's visit to US, 6 nuclear reactors were decided to be built in India by the American firm Westinghouse.
  \n
- Despite bilateral agreements, there is no sign yet of any contract between an American company and the Indian authorities.
  \n

\n\n

What are the challenges?

\n\n

\n
- The U.S. sending the Westinghouse officials to India will reopen negotiations on the deal.
  \n
- Before deciding on a go ahead with the commercial contract, the Indian government should consider the following:
  \n
- **Liability** - Westinghouse went into major cost overruns leading to a financial crisis.
  \n
- It had to halt two of its reactors projects in the U.S, by when the construction was already 5 years over schedule.
  \n
- Amidst this, the Westinghouse’s new buyers have already diluted the arrangement in India.
  \n
- They will not construct the nuclear power project in India, and will only supply reactors and components.
  \n
- Even if the India-U.S. techno-commercial contract gets finalised in 2019, it would take nearly another 10 years to construct a reactor.
  \n
- Given this, in case of a Fukushima-type nuclear accident in India, the liability that U.S. companies would carry is highly uncertain.
  \n

- **Trump effect** - Trump’s US presidency has taken a sharp turn away from renewable energy.
\n
- There are increased calls for mining, exporting and encouraging oil, gas, coal and shale trade into its foreign outreach.
\n
- Notably, India recently, made orders for both oil and gas shipped from America.
\n
- India may stand to loose Obama era support in financing renewable energy projects and facilitating India-U.S. nuclear deals.
\n
- Also, the US has pulled out of the Paris climate change accord, coming as a shock for India.
\n
- Notably, Obama administration had promised to help India reduce its dependence on fossil fuels on India's entry into Paris accord.
\n
- **India's requirements** - India’s own requirements from the India-U.S. civil nuclear deal have changed considerably.
\n
- The Cabinet recently approved the 7,000 MW construction plan for 10 Indian-made pressurised heavy water reactors (PHWRs).
\n
- With existing constructions and the current capacity of 6,780 MW, India hopes to have 14,600 MW of nuclear power by 2024.
\n
- Besides the nuclear power plants, the Department of Atomic Energy is advocating PHWRs in more inland sites.
\n
- This includes sites in Rajasthan, Haryana, Karnataka and Madhya Pradesh.
\n
- It comes in the backdrop of concerns on too many nuclear projects in the southern coastline lying along tsunami and earthquake faultlines.
\n
- India has also found much more comfort in its existing agreement with Russia’s Atomstroyexport.
\n
- This began with the Intergovernmental Agreement for Kudankulam 1 and 2 in 1988.
\n
- It has kept a slow but steady pace in delivering reactors and operationalising power projects.
\n

- **Cost** - Another issue relates to the cost that India is prepared to pay for nuclear energy through foreign collaborations.
\n
- Indo-French negotiations for six 1,650 MW European Pressurised Reactors (EPRs) in Maharashtra's Jaitapur is delaying.
\n
- This is notably over the differences between Department of Atomic Energy and the French company Areva (now handed over to EDF Energy company, UK).
\n
- It pertains to arriving at the cost per unit.
\n
- **Besides** - India must consider the shifts in the world nuclear industry before getting into negotiations with new companies.
\n
- Many nuclear companies globally are facing with major losses over their nuclear businesses.
\n
- As the pressure to lower nuclear power tariffs increases, nuclear safety requirements have become more stringent.
\n
- More countries now see nuclear power as a "base-load" option.
\n
- It is only preferred as a back-up option for unstable, but infinitely less costly and eco-friendly, solar and hydroelectric power options.
\n
- All these signal that nuclear power is losing its primacy in the energy mix, which India must be aware of.
\n
