

## Rising Fiscal Deficit - Causes

### What is the issue?

\n\n

\n

- The government's fiscal deficit touched 114.8% of the full-year estimates at the end of November. Click [here](#) to know more.

\n

- It is essential that the government wake up to other causes beyond the oil import impact.

\n

\n\n

### What is the current trade scenario?

\n\n

\n

- India's external account has once again emerged as a source of concern.

\n

- Notably, the current account deficit has widened to reach 2.4% of GDP over April-June 2018.

\n

- This increase was driven entirely by the trade deficit, which grew rapidly in 2017-18.

\n

- **Exports** - Since 2014, exports have been mostly stagnant (after a period of healthy increases before then).

\n

- But, total imports came down and then increased sharply in 2017-18.

\n

- This was reflected in the total merchandise trade deficit.

\n

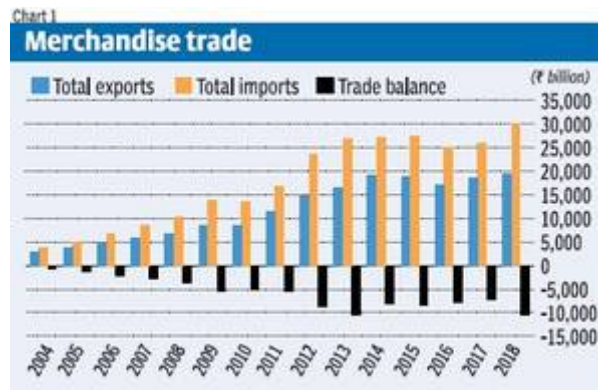

- Trade deficit declined for several years from the large deficit observed in 2013-14, and only rose sharply once again in 2017-18.

\n

- Over the period April-November 2018, the trade deficit is once again said to have widened.

\n

\n\n

\n\n

## How was the oil price impact?

\n\n

\n

- It is true that India benefited hugely from the global decline in oil prices in the first 4 years of current government's tenure.

\n

- Evidently, the overall oil price scenario -

\n

\n\n

\n

- i. reduced the pressure on the balance of trade

\n

- ii. contributed to lower rates of domestic inflation

\n

- iii. provided windfall gains to the public coffers

\n

\n\n

\n

- Notably, the government did not pass on most of the oil price decline to consumers but instead raised tax rates.

\n

- However, with India being net importer of oil, global oil prices have been suggested as the significant driver of the total trade deficit.

\n

- Periods of rising global oil prices have therefore been associated with higher total imports and vice versa.

\n

- So naturally, the external deficit is assumed to be driven by factors outside domestic policy control.

\n

\n\n

## Is oil price the only factor for trade deficit?

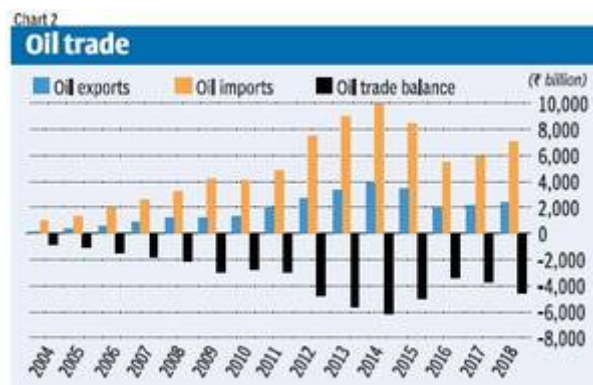

\n\n

\n

- India is both an exporter and an importer of petroleum products.
- Also, there is growing involvement of domestic oil refinery and distribution corporations (particularly the private ones).
- Quite often, increased oil exports reflect the choices domestic oil companies make - to produce for the domestic market or to export.
- These, in turn, are related to the local prices and duties, therefore driven by domestic policy.
- The oil trade balance thus indicates that the oil deficit can increase even in periods of relatively low global oil prices (as in 2016-17).
- This is because of the choices made by Indian oil corporations, especially the private players like Reliance.
- So the impact of oil prices on balance of trade is not quite simple and is not driven only by external factors as it is believed to be.

\n

\n\n

\n\n

## What are the other factors?

\n\n

\n

- Non-oil imports have typically been high and rising rapidly.  
\n
- Even in the mid-2000s, non-oil trade was largely in balance and then began to show only relatively small deficits from 2006 onwards.  
\n
- After 2008, such deficits grew rapidly, as imports kept growing much faster than exports.  
\n
- Resultantly, the non-oil merchandise trade deficit peaked in 2012-13, ironically a time when global oil prices were also not that low.  
\n
- They came down the following year, but then rose once more, as non-oil imports kept expanding rapidly.  
\n
- It is to be noted that this increase was driven by increasing import volumes, as the prices for many of India's imports also remained low.  
\n
- Low prices indicate that the potential of imports to displace domestic production has been much greater.  
\n
- Increased imports of various final goods have added to the woes of many small-scale producers in agriculture and industry.  
\n
- In all, even in the period of rise in oil prices in 2017-18, the non-oil trade deficit was even larger than the oil trade deficit.  
\n

\n\n

### **What does it imply?**

\n\n

- High global oil prices are only one of the many reasons why India should be concerned about the rising external trade deficit.  
\n
- The more significant causes lie elsewhere, and some are domestic.  
\n
- The government should take note of this, and address the developments in non-oil imports too.
