

## Road Safety

### What is the issue?

\n\n

\n

- In 2015, there were over 4,50,000 accidents in the country, of which nearly 1,50,000 were fatal, amounting to 410 deaths and some 1,300 injuries every day.

\n

- National highways and state expressways accounted for two-thirds of these deaths.

\n

\n\n

### What are some of the myths about road accidents?

\n\n

\n

- The US, UK and Japan, where the accident rate was increasing till 1970, when a number of measures made roads safer. The improved design and technology of cars also led to a fall in accidents.

\n

- But in many Indian cities, according to the National Crime Records Bureau, **the accident rate has gone up two to five times in the last five years** — this must be due to the burgeoning “automobilisation” of our society.

\n

- A researcher from IIT Delhi is fond of challenging the mythology that penal measures by themselves lead to better safety.

\n

- He believes there was a paradigm shift abroad: Instead of forcing people to adapt to traffic situations, countries worked on eliminating risk factors from traffic.

\n

- In other words, **instead of blaming bad drivers**, the authorities treated people as “normal” and worked on reforming the system.

\n

- Another myth is that as countries get richer, the number of accidents decline.

\n

- But, an urbanised and literate state like Tamil Nadu topped the fatality rate among states in 2014, followed by Himachal Pradesh, Haryana, Karnataka and Andhra Pradesh.

\n

\n\n

## **What could be done?**

\n\n

\n

- The alternative approach, such as that adopted in Sweden, is to **shift the onus for accidents from drivers to the road transport system.**

\n

- The system must be so designed that it accommodates the individual who has the worst protection and lowest tolerance to road violence.

\n

- This would obviously include the **young, elderly and physically challenged.**

\n

- The much-vaunted “greening” of highways in India, without proper safeguards, is actually hazardous because a speeding car can veer off and hit a tree, proving fatal.

\n

- Roundabouts at important intersections can greatly reduce accidents, as much of Lutyens’ Delhi should know.

\n

- It is a no-brainer that a reduction in traffic speed reduces accidents, so devices such as speed-breakers are essential.

\n

- The American Journal of Public Health points out that speed “humps” reduce the dangers to children by a half to two-thirds.

\n

- A 1% increase in speed leads to a 3% increase in deaths, which is why New York City has reduced the maximum speed from 50 to 40 kmph.

\n

- Four-lane highways are very accident-prone, which is why all traffic “calming” measures are required.

\n

- Simple improvements, like **bright lights at junctions, speed cameras, a police presence and making helmets compulsory** can work wonders.

\n

- Seat belts worn even at the rear, which is seldom done here, can lower the risk of death to occupants by upto three-quarters.

\n

\n\n

## What is the way forward?

\n\n

\n

- The bill to amend the **Motor Vehicles Act** passed by the Lok Sabha last week, by increasing fines five-fold and even more, misses the point because **drivers aren't necessarily deterred by such fines.**

\n

- Instead, frequent, visible and unpredictable checks not by electronic means will help more.

\n

- Further, there are **no permanent safety experts in central agencies** like the National Highways Authority of India and in states.

\n

- However, given that drivers of vehicles on highways earn around Rs 15,000 a month, fines and other measures may indeed act as a caution.
