

Spectrum Cap

Why in news?

\n\n

\n

- Vodafone and Idea are in merger talks.

\n

- They are planning to ask the Department of Telecommunications (DoT) to relax the ceilings on spectrum ownership.

\n

\n\n

What is the spectrum cap?

\n\n

\n

- Energy travels in the form of waves known as electromagnetic waves.

\n

- These waves differ from each other in terms of frequencies.

\n

- This whole range of frequencies is called the spectrum.

\n

- In telecommunication like TV, radio and GPRS, radio waves (electromagnetic waves) of different wavelengths are used. They are divided into **bands** based on frequencies.

\n

- The spectrum cap is the limit of radio-waves a telecom operator can hold for providing wireless services.

\n

\n\n

What is the current rules?

\n\n

\n

- Spectrum cap rules are to prevent an operator from accumulating unreasonable amount of spectrum that might result in the monopoly of the operator.

\n

- At present, a single telecom network cannot own more than 50% of the wavelengths in a single band and 25% of all the wavelengths assigned in a telecom circle.

\n

\n\n

Why the ceiling should be reduced?

\n\n

\n

- If these two telcos actually merge, the resultant entity would need to surrender a significant amount of spectrum under these current rules.

\n

- **Irrelevant** - These restrictions were put in place when there were 8 - 10 networks in each circle to protect the smaller networks from the bigger ones.

\n

- But this hyper-competition has been reduced leading to around four large networks in each circle. Hence the current rules become irrelevant.

\n

- **CCI** - Though cartelisation amongst the networks is a genuine threat, but there is Competition Commission of India to ensure that it doesn't happen.

\n

- **Quality** - If the base of a network's subscribers rises, its inability to buy spectrum will **severely impact the quality of its service**.

\n

- **Restricted choices** - A smaller network can't sell its spectrum since the caps restrict their choice. It can only negotiate with those networks which have spectrum way below the ceiling.

\n

- **Consumption increase**- In the last few years, there is a steep rise in data consumption. So, the networks need more wavelengths. But their efforts are hindered by the caps.

\n

- **It also impacts the ease of doing business** as the exits of network and consolidation are being difficult because of the cap.

\n

- The government wants to leverage mobile networks for better governance which would also require more spectrum.
