

## Stabilising Onion Price

### What is the issue?

\n\n

\n

- Recently, retail prices of onion touched Rs 50/kg in several markets and the wholesale prices touched Rs 30/kg.

\n

- This is in the backdrop of a bumper crop year earlier this year, that forced farmers to sell onions at as low as Rs 2/Kg in May.

\n

- This stresses the urgent need for “scientific storage facilities and a judicious trade policy”.

\n

\n\n

### How was the price crash handled?

\n\n

\n

- While the boom and bust in onion prices happens almost every alternate year, 2017 is interesting as it saw record low prices.

\n

- The situation became precarious when farmers protested and police fired at them, resulting in some unfortunate deaths.

\n

- Madhya Pradesh CM realised the sensitivity of the incident and quickly announced a decision for massive procurement.

\n

- Onions were bought at Rs 800/quintal and state agencies procured around 8.76 lakh tonnes.

\n

- But in the absence of ample storage capacity, onions had to be quickly sold through PDS & open markets.

\n

- Notably, onions were disposed at almost one-fifth the cost and the whole operation caused a loss of Rs 785 crores.

\n

\n\n

## What is the recent price trend?

\n\n

\n

- In August, prices started shooting up, which gave rise to speculations of hoarding by traders.

\n

- Consequently, inspections by the Ministry of Consumer Affairs, IT raids on traders were conducted.

\n

- Trade was also suspended in the Lasalgaon APMC for a month.

\n

- Despite these actions, the prices kept rising, prompting the government to announce import of onions to bring down prices.

\n

- Notably, such random government actions are common every year.

\n

- Last year too, government fixed a minimum export price, banned exports for a while.

\n

\n\n

## How does the Onion Production calendar look?

\n\n

\n

- India produced 21.7 MMT of onions annually, which is about 20% of global production in 2016-17, next only to China.

\n

- Of this, 2.4 MMT was exported in 2016-17, which was up from 1.2 MMT in 2014-15.

\n

- **Rabi Crop** - About 60% of onion production is in the rabi season, sown in December-January and harvested in April-May.

\n

- This onion is stored by farmers and traders and it meets export as well as domestic demand till the arrival of the kharif onion.

\n

- **Kharif Crop** - Kharif onion is sown in May-June and harvested in October-November.

\n

- A late kharif crop is also sown in August-September and harvested in

January-February.

\n

- Both produce about 20% each of the total annual production but both are of poor quality and can't be stored for long.

\n

\n\n

### **What are the reasons for high price volatility?**

\n\n

\n

- Prices tend to rise in October-November, when rabi stocks are almost depleted and kharif onion is yet to hit the markets or if the crop fails.

\n

- High price volatility also stems from a lack of storage facilities that have not kept pace with rising production.

\n

- Also, the traditional storage practices incur losses as high as 40%.

\n

- Notably, Maharashtra used the Rashtriya Krishi Vikas Yojana and National Horticulture Mission and created 42,282 low-cost onion storage structures with a capacity of 9.65 lakh tonnes.

\n

- But, there is hardly any storage facility in MP, which is reflective of why MP farmers suffered most in this year's bumper onion crop.

\n

\n\n

### **What can be done?**

\n\n

\n

- **Storage** - Modern cold storages, as being set up by companies like 'Allround India' can bring down wastage within the 10-15% range.

\n

- Hence, promoting modern cold storages and developing a system akin to that of the warehouse receipt system for farmers is needed.

\n

- While encouraging the private sector to take the lead, the state can do some stocking under a 'Price Stabilisation Fund - PSF'.

\n

- **Trade Policy** - An effective trade policy that is responsive to production realities is necessary for price stabilisation.

\n

- Promoting exports in case of a bumper crop and encouraging imports in case of deficits should be primary to any trade policy.  
\n
- This has to be done well in advance — as soon as one comes to know the advance estimates of production.  
\n
- **Processing** - Encourage the setting up of onion dehydrating units and promote demand for dehydrated onions can be considered.  
\n
- Currently, Gujarat has already emerged as the main centre for dehydration units with 85 out of 100 units located there.  
\n
- Dehydrated onions are being exported to Japan, Europe, Russia, US and some African countries.  
\n
- Ministry of Food Processing and state governments should encourage entrepreneurs to setting up onion processing units.  
\n
- While a subsidy of up to 35% with a cap of Rs 5 crore is currently being provided, the budget of the scheme is just Rs 95 crore.  
\n
- This needs to go up manifold if we are serious about encouraging food processing and stabilising prices.
