

Stubble management for addressing air pollution

What is the issue?

\n\n

\n

- The air quality index for Delhi, Ghaziabad and Noida were in the 'severe' category with values of 469, 500 and 500 respectively according to the Central Pollution Control Board.

\n

- Incentivising alternative uses of stubble and promoting technological solutions to recycle it can help check pollution.

\n

\n\n

What are the factors contributing to air pollution?

\n\n

\n

- Stubble burning by farmers in neighbouring Punjab and Haryana is the prime reason.

\n

- Stubble burning is still continuing in this regions despite it being banned by the Punjab Pollution Control Board.

\n

- Construction dusts and high traffic had also aggravated air pollution in Delhi and surrounding cities.

\n

- This coincides almost each year with the onset of foggy winters in North India.

\n

\n\n

What measures need to be taken to address stubble burning?

\n\n

\n

- **Stubble management** -In most rice growing regions of Andhra, Tamil Nadu and Karnataka, farmers get economic value for paddy straw by selling it as

cattle feed.

\n

- Both Punjab and Gujarat are home to sizeable dairy co-operatives, which can follow South India's model.

\n

- There is a huge agri-business opportunity for the farmers in this region by trading nutrition-rich stubble for livestock and unlocking a potential value-added chain.

\n

- **Economic incentives** -Investment by State governments in ramping up mechanisation with built-in incentives for farmers will help generate additional income for farmers.

\n

- It will also create additional employment opportunities in this region.

\n

- **Private partnership** -In much of the US and Europe, crop stubble is cut into bales, and is a much sought after by mushroom growers, livestock owners, and for pulp.

\n

- Crop stubble can be repurposed to create another value chain around low-cost, eco-friendly wood products.

\n

- For all this private sector and its expertise can be roped in to create necessary infrastructure and transport links to connect the farms to retail markets.

\n

- **Encouraging Innovation** -Punjab Agricultural University had invented a Super-Straw Management System (SSMS).

\n

- It works to cut, take out stubble, drill wheat seeds, and evenly deposit any loose crop residue over the farm.

\n

- SSMS deposits crop residue over the farm, adding organic matter over time, retaining nutrients, water and replenishing soil structure.

\n

- Such innovations need to be encouraged by the government till it reaches every farmers of this region.
