

Sugar Waste to Fertiliser

Why in news?

 $n\n$

CSIR lab has developed a solution to separate hazardous pollutant from organic matter in sugarcane distillery process.

 $n\n$

What are the concerns with sugarcane distillery process?

 $n\n$

\n

- For every litre of alcohol produced from fermentation of sugarcane molasses, distilleries generate 10-15 litres of wastewater effluent or "spent-wash".
- Molasses-based distilleries in India churning out 2.5-2.6 billion litres of alcohol discharge 30-35 billion litres of this hazardous residual liquid annually.

۱'n

• This Spent-wash if disposed untreated can contaminate surface and ground water

۱n

• Distilleries in India currently manage their spent-wash mainly by converting it into manure by mixing the wastewater with press-mud, a residue from sugar mills.

\n

• However, press-mud is available only during the 150-160 days when the mills are running, forcing the distilleries to limit their operations to the crushing season.

\n

 $n\n$

What is the recent development of CSIR lab?

 $n\n$

۱n

• The Central Salt & Marine Chemicals Research Institute (CSMCRI) will

recovery potash salts from the "lean" spent-wash, which then undergoes evaporation to yield recycled water and residues.

\n

- \bullet The residues are further mixed with the organics recovered in the first stage. $\mbox{\ensuremath{\mbox{\sc h}}}$
- The technology separates complex organic compounds from spent-wash through a coagulation process.
- This generates valuable organic matter (which can be converted into animal feed formulations), potassium nitrate (fertiliser) and reclaimed water (reusable in the molasses fermentation process).
- The process yields 10 tonnes of complex organics, 2.5 tonnes of potassium nitrate and 75,000-80,000 litres of recycled water from every one lakh litres of spent-wash.

\n\n

What is the significance of this development?

 $n\n$

\n

- The recent technology will help distilleries comply with the Central Pollution Control Board's mandated zero liquid discharge (ZLD) action plans.
- \bullet It would also meet up to a tenth of India's potassium-based fertiliser requirements, now entirely met through imports. $\mbox{\sc h}$
- This will encourage more distilleries to come up and produce ethanol for blending with petrol, cutting the country's oil import bill and bringing sugarcane growers better returns.
