

Taxing the Carbon Emission

What is the issue?

\n\n

\n

- Air pollution is becoming one of the biggest public concerns in India.
- India needs a Carbon-tax policy to curb air pollution.

\n

\n\n

What is the contribution of fossil fuels to air pollution?

\n\n

\n

- About 75% of all greenhouse gas emissions are CO₂ emissions produced through burning fossil fuels oil, coal and natural gas to generate energy.
- Since the early 2000s, carbon emissions have increased because of high growth in the Indian economy.
- In 2014, India's total carbon emissions were more than three times the levels in 1990, as per World Bank data.
- This is because of India's heavy dependence on fossil fuels and a dramatically low level of energy efficiency.

\n

\n\n

What is a carbon tax?

\n\n

\n

- A carbon tax is a way to make users of carbon fuels pay for the climate damage caused by releasing carbon dioxide into the atmosphere.
- The amount of CO₂ released in burning any fossil fuel is strictly proportional to the fuel's carbon content.

- \n
- This makes a carbon tax simple to measure and document.

\n

\n\n

- \n
- Which allows the carbon tax to be levied “upstream” on the fuel itself when it is extracted from the ground or imported.

\n

\n\n

- \n
- Placing a tax on carbon gives consumers and producers a monetary incentive to reduce their carbon dioxide emissions.

\n

\n\n

How can India make use of carbon tax?

\n\n

- \n
- The Indian economy’s energy mix needs to be remodelled through investments in clean renewable sources of energy like solar, wind, hydro, geothermal and low-emissions bioenergy.
- \n
- This energy mix overhaul requires an additional 1.5% of GDP (to the current annual level of 0.6%) annually over the next two decades.
- \n
- This can be financed by the carbon tax revenue, it will be a revenue-neutral policy with no implications on the fiscal deficit.
- \n
- Carbon revenue can be used for a transfer of free electricity to the population that contributes less carbon than the economy average.
- \n
- Carbon taxes also delivers on providing more employment since the employment elasticity in greener forms of energy is higher than those in fossil fuel-based energy.
