

# The Case for "Green GDP"

#### What is the issue?

\n\n

∖n

- Development sans environmental preservation is a mirage.
- Hence, India must calculate its "Green GDP" to factor in the value of the environment in its growth.

\n

\n\n

### What are the environmental impacts of development?

\n\n

∖n

- A recent World Bank report states that it cost India about \$550 billion amounting to about 8.5% of its GDP, due to air pollution.  $\n$
- Experts have also vouched that the cost of externalities due to water pollution and land degradation were possibly far higher.  $\n$
- Our disregard for environment in pursuit of advancing economic development is raising the risk of desertification and land degradation significantly.

∖n

- Not surprisingly, estimates are that our food production could see a loss of 10-40% if these trends continue unabated.
- $\bullet$  While natural capital like water and clean air is self regulating, it needs to be handled sustainably in order to avoid depletion.  $\n$
- For this, it is crucial to understand the environmental footprint of our economic activities, which also needs to be accounted in our GDP.  $\n$

\n\n

### How can environmental footprint be accounted in GDP?

∖n

- Natural capital can cover entire ecosystems such as fisheries and forests, besides multiple other hidden and overlooked ecological services.  $\n$
- Regeneration of soil, nitrogen fixation, nutrient recycling, pollination and the overall hydrological cycle are all components of natural capital.  $\n$
- Valuing such ecosystem services is challenging as these aspects can't be monetised directly, but their depletion does reduces productivity.  $\n$
- Giving a monetary value to this depreciation to natural capital is also not exactly possible as the numbers are interpretative in nature.  $\n$
- To address these issues, concepts like "environmental Kuznets curve" that plots "per capita GDP" against "Sulphur dioxide concentration" in the local air have been put forward.

\n

\n\n

### What are the possible dangers?

\n\n

\n

- $\bullet$  India routinely suffers from high levels of air pollution that impose costs on local transport, health and liveability in urban and rural areas.  $\n$
- When economic growth leads to the destruction of forests, wetlands, mining or even urban expansion, it is typically the poorest who suffer.  $\n$
- Full-scale ecological collapse is already visible in the Darfur region of Sudan and countries in the Horn of Africa.  $\n$
- Indian people and policy makers need to act immediately and coherently to arrest such rapid socio-economic decline.  $\n$

\n\n

## What have been the significant efforts taken thus far?

\n\n

\n

• India's current national accounts already do incorporate such environmental

\n\n

considerations in a limited fashion but it is not comprehensive.  $\ensuremath{\sc n}$ 

- In this context, it was planned in 2013 to release a comprehensive "Green GDP" estimate in 2013, and the various departments started working on it.  $\n$
- But lack of micro level data on natural capital formation (and destruction), proved a major constrain and the exercise never saw completion.  $\n$
- The 12th Five Year Plan undertook groundwater resource mapping at the national level, which was indeed a significant exercise  $\n$
- Similar comprehensive exercises are now essential for data on land usage, forests and mineral wealth.
