

The Uneven Fallouts of Globalisation

What is the issue?

\n\n

\n

- Globalisation thrives on establishment of trade circuits worldwide.
- As different regions are placed at different levels within circuits, the impact of globalisation isn't uniform throughout the world.
- Our policy makers need to become sensitive to this obvious structure of globalisation, when they plan infrastructure projects.

\n

\n\n

How has globalisation unfolded over the years?

\n\n

\n

- **Initially** - In the early 90s, when many economies were opening up their markets worldwide, there was a sense of euphoria about globalisation.
- It was seen as a process that would collectively benefit all due to the "economics of scale, access to diverse products and cost effective markets".
- It was believed that the communication lines that are opening up would lead to synchronisation of living conditions across the world.
- **Reality** - The idea of an interconnected harmonious evolution of equally poised global village has withered greatly over time.
- Part of the ploy was lost due to a spike in economic inequalities between countries and between people within a country.
- Technology has indeed opened communication lines, but that hasn't necessarily lead to establishment of significant interconnectedness.

\n

- In reality, globalisation is more about specific circuits that are enabled by technology but are realised for economic and political purposes.

\n\n

How does globalisation impact different areas differently?

\n\n

- Globalisation as concept inherently can't be even worldwide.
- **What** - Globalisation works through the establishments of trade circuits worldwide, a trend that has intensified with better communication technology.
- The impact of globalisation on a city depends on which end of the trade circuit it finds itself in - namely commander or supplier.
- The city that commands and controls a circuit faces very different conditions from the city that merely supplies resources on command.
- **Examples** - Garment industry is a typical example, where command structures are located in developed countries, catering to fashion needs there.
- Garment suppliers are usually based out of emerging market economies that primarily shell out cheap underpaid labour to the west.
- The Information Technology (IT) industry too is similarly dispersed worldwide to satiate the demands of the western world.
- **Fallouts** - In such relationships, the former usually thrives with a rich outlook, while the latter merely survives on the margins of the global economy.
- This is because, the terms of the presently prevalent economic contract is skewed in favour the command centres as against the suppliers.
- **Churn** - There is always a possibility for firms at the supply end of the circuit to rise to the position of command and control in certain niche areas.
- But this is rare, and might also demand such firms to move to locations

where other command structures are located for economic reasons.

\n

- In either case, supplier cities largely continue to remain suppliers for the international markets, and those residing in them lead a meagre living.

\n

- **Inertia** - For a city as a whole to become a command centre, there needs to be a comprehensive demographic and politico-economic evolution.

\n

- This is hard to come by in a long time and is almost impossible under the current international economic and political order.

\n

\n\n

What is the irrationality that dominates our policy narratives?

\n\n

\n

- “Indian urban policy” is invested in building infrastructure and replicating the structures of globally acclaimed cities in India.

\n

- In this context, a mad rush to build world class airports, massive expressways and high-speed rail projects has been unleashed.

\n

- The touted reason for such connectivity projects is to reduce travel time between cities, but it is an end that in itself is futile.

\n

- Additionally, navigating through city traffic in major cities seems more nightmarish than travelling between those cities in India.

\n

- Hence, infrastructure is seemingly being built just for the sake of it, as the government strongly believes that infrastructure will usher in development.

\n

- Importantly, in the midst of this craze, the financial and social costs of the projects are being overlooked beyond prudential levels.

\n

\n\n

What are the risks of such an irrational approach?

\n\n

\n

- Cities that are command centres have to be attractive for its inhabitants

and hence have to flaunt an aura of attractiveness and richness.

\n

- Contrastingly, supply centre cities usually have a large population that is poor and hence needs to be affordable to accommodate them.

\n

- Our policy makers fail to make this basic distinction between cities on the differing ends of the global trade circuit.

\n

- Resultantly, they are unleashing projects with little knowledge about its economic potential and little prudence for the costs being incurred.

\n

- The risk of such high-headed policy making is that, it would lead our cities becoming costly, which would hit the poor masses the most.

\n

- Additionally, as a result of becoming costly, our cities might lose the cost-effectiveness edge, and thereby see a reduced global demand for its supplies.

\n

- In this lies the risk of losing business and thereby jobs, which would add to the nation's economic pain.
