

Tiangong-1 Downing and Space Debris

What is the issue?

\n\n

\n

- The recent downing of Tiangong-1 ended concerns about where the debris from the space station would fall.

\n

- It has however reignited the larger debate about space debris itself.

\n

\n\n

What is Tiangong-1?

\n\n

\n

- Tiangong-1 is China's space station.

\n

- Launched in 2011, it made China just the third country to launch a space station.

\n

- The Chinese used it to demonstrate spacecraft docking capabilities.

\n

- Six astronauts visited Tinangong-1 in 2012 and 2013 in two crews.

\n

- It included China's first woman astronauts, Liu Yang and Wang Yaping.

\n

\n\n

What happened to it?

\n\n

\n

- Chinese lost control of the station in 2016.

\n

- After losing control, China notified the United Nations Office for Outer Space Affairs and the Inter-Agency Space Debris Coordination Committee.

\n

- Much of Tiangong burnt up in the atmosphere, until it finally splashed into

the ocean.

\n

- Weighing 8.5 tonnes, it dropped out of orbit and splashed into the South Pacific Ocean, just northwest of Tahiti.

\n

- Tiangong-2 continues to be operational.

\n

- This lab was launched the same year the Chinese lost control of the now-downed space station.

\n

\n\n

What are the concerns with space debris?

\n\n

\n

- At least 500,000 pieces of space debris, of various sizes, are orbiting the Earth.

\n

- Nearly 7,500 tonnes of estimated amount of defunct, artificially created objects are currently in space.

\n

- The speed up to which space junk travel is 28,000 kph.

\n

- This is fast enough to destroy a spacecraft.

\n

- Probability of an individual on Earth being hit by falling debris is 1 in 1 trillion.

\n

- **ISRO** - PSLV-C19 had launched radar imaging satellite RISAT-1 in 2012.

\n

- Recently, PSLV-C19's 4th stage burnt up over the Central Atlantic.

\n

\n\n

What is a spacecraft graveyard?

\n\n

\n

- There are larger space objects that may not entirely burn up before reaching the ground.

\n

- Spacecraft operators can thus plan for the final destination of their old satellites to make sure that any debris falls into a remote area.

- A 1,500 sq km area in Southern Pacific Ocean is said to be the spacecraft graveyard or spacecraft cemetery.
- This is suitably far from any coast and human habitations thereby.
- Notably, more than 260 satellites were brought down there so far.

\n\n

What could be done?

\n\n

- \n
 - **Passivation** - Satellite explosions are reduced by deactivating various systems.
 - \n
 - **Design for demise** - Designing with material that burn up on re-entry.
 - \n
 - **Deorbiting systems** - Under international guidelines, satellites are brought down within 25 years after mission life.
 - \n
 - **Design for servicing** - Grips or handles can be caught by a robotic arm or astronauts for repairs.
 - \n
 - **RemoveDEBRIS** - An innovation led by University of Surrey's Space Centre, UK.
 - \n
 - It was launched on a SpaceX flight to International Space Station recently.
 - \n
 - It will be released into low-earth orbit, where it will release a smaller satellite that will recapture space junk with a harpoon.
 - \n
 - **ISRO** - ISRO is looking to develop reusable launch vehicles.
 - \n
 - It had notably conducted a space capsule recovery experiment in 2007.
 - \n

\n\n

Quick Fact

\n\n

United Nations Office for Outer Space Affairs (UNOOSA)

\n\n

\n

- The UNOOSA works to promote international cooperation in the peaceful use and exploration of space.

\n

- The Office assists any United Nations Member States to establish legal and regulatory frameworks to govern space activities.

\n

- It also strengthens the capacity of developing countries to use space science technology and applications for economic and social development.

\n

- It does this by helping to integrate space capabilities into national development programmes.

\n

\n\n

Inter-Agency Space Debris Coordination Committee (IADC)

\n\n

\n

- The IADC is an international governmental forum.

\n

- It works for worldwide coordination of activities related to the issues of man-made and natural debris in space.

\n

- The primary purposes of the IADC are to -

\n

\n\n

\n

- i. exchange information on space debris research activities between member space agencies

\n

- ii. facilitate opportunities for cooperation in space debris research

\n

- iii. review the progress of ongoing cooperative activities

\n

- iv. identify debris mitigation options
