

Understanding the Investment Decline

What is the issue?

 $n\n$

\n

• There is a decline in overall investment rate between 2011-12 and 2016-17 in India.

\n

• The household, and not corporate, sector is said to be responsible for the decline.

\n

 $n\$

How important is investment?

 $n\n$

۱n

• Growth can occur with better utilisation of existing capacity or with new investment.

۱n

• However, over the medium to long term, the key driver of growth is investment.

۱'n

Without a high investment rate, it is difficult to sustain a high growth rate.

 $n\n$

How has income growth been?

 $n\n$

\n

• Over the last 4 years, the growth rate has been maintained at a reasonable level.

\n

 $n\n$

\n

• The <u>average</u> growth rate of GDP has been 7.3%.

\n

- However, the declining trend is a cause of concern.
- The growth rate of GDP in 2015-16 was 8.2%.
- It came down to 7.1% in the following year and 6.7% for the just ended year. $\$

 $n\n$

How has savings been?

 $n\n$

۱n

 \bullet The major source of funding investment is domestic savings.

\n

• The gross domestic savings rate has <u>fallen</u> in the <u>last six years</u>.

 \bullet It has declined from around 34% of GDP in 2011-12 to around 30% in 2016-17.

\n

• The steepest decline in savings has been with respect to the <u>household</u> <u>sector</u>.

\n

• Within this, both financial savings and that in physical assets have declined sharply.

\n

• The <u>private corporate sector</u> savings have actually increased by almost 2.5 percentage points.

\n

• The savings rate of the <u>public sector</u> including general government shows no change.

\n

 $n\n$

How has the investment trend been?

 $n\n$

۱n

- **Trend** The investment rate also registers a disturbing <u>decline</u>.
- In 2011-12, the gross fixed capital formation rate was around 34% of GDP.
- By 2016-17, it had come down to around 28%.
- Understanding the behaviour of different components of fixed capital

formation is crucial to address the declining trend.

- Components - Investment (gross capital formation) includes three elements: \n

 $n\n$

\n

i. gross fixed capital formation

\n

ii. change in stocks

۱n

iii. valuables (e.g. gold)

\n

 $n\n$

\n

• The most important component is gross fixed capital formation.

\n

• It refers to the capital expenditures on machinery and equipment and dwellings.

۱n

• The gross fixed capital formation rate fell over the period from 2011-12 to 2016-17.

۱n

- However, Gross fixed capital formation stayed at a little above 7% of GDP.
- <u>Public sector</u> including general government showed no change.
- \bullet $\underline{\text{Private corporate sector investment}}$ showed in fact a rise.

\n

• Hence, the only sector that appears to have been responsible for the decline in investment is <u>households</u>.

\n

- Household sector's fixed capital formation rate has shown a steep decline.
- \bullet It has declined from around 15% to nearly 9% over the six-year period. $\ensuremath{\backslash n}$

 $n\n$

Why is the trend a cause for concern?

 $n\n$

\n

• **Base Year** - The base year for these indicators had been revised from 2004-05 to 2011-12.

\n

• Notably, the investment ratios according to the new series with base show a much higher rate as compared to the old series.

۱n

• E.g. the gross fixed capital formation rate for 2011-12 was 31.8% according to the older series.

۱n

• For the same year, it is 34.3% according to the new series.

• But despite the new series, the investment rate has been declining since 2011-12.

\n

• **Cause** - The focus for the slowdown in growth has been on weak investment demand by the corporate sector.

\n

• There has been increased attention to the number of stalled projects.

• This has been interpreted as a failure of the corporate sector to make investment.

\n

 \bullet But the decline in gross fixed capital formation rate has actually been caused by the <u>household sector</u> rather the corporate sector. \n

 $n\$

Why is the household sector a cause?

 $n\$

\n

• Household sector's savings in physical assets, which is the same as investment, is normally in the form of housing.

\n

• But it is difficult to attribute the sharp decline only to the reduction in investment in housing.

\n

• Notably, the term 'households' includes not only individual households but also <u>non-corporate business</u>.

\n

• By definition what is <u>not government and private corporate</u> comes under the category of households.

\n

• Households' investment in machinery and equipment came down in 2012-13 to 2015-16 period.

\n

- \bullet Therefore, in part <u>small businesses</u> have suffered more and invested less.
- Within the business sector, the non-corporate business seems to have borne a higher burden.

\n

- Thus, the fall in investment rate as an explanation for the slowdown in growth is reasonable.
- \bullet But clearly, the corporate investment, as believed, is not the cause. $\mbox{\ensuremath{\backslash}} n$
