JADES-GS-z14-0 & JADES Program

A new study has detected the 2 earliest and most distant galaxies.

- **JADES-GS-z14-0** - It is estimated to have formed about 290 million years after the Big Bang, making it the earliest-known galaxy.

*The **Big Bang theory** proposes that the universe began from an infinitely hot and dense single point, known as a singularity, around 13.7 billion years ago.*

- **Observed by** - NASA's [James Webb Space Telescope \(JWST\)](#)
- **Umbrella programme** - **JADES program** (JWST Advanced Deep Extragalactic Survey).
- **Location** - It measures about 1,700-light years across.

A light year is the distance light travels in a year, which is 9.5 trillion km.

- **Mass** - It is equivalent to 500 million stars the size of our Sun and is rapidly forming new stars, about 20 every year.
- **Size** - It is significantly larger than other galaxies that the JADES team has measured at these distances.
- **Luminous** - It is brighter.

Galaxies tend to grow larger as the universe evolves, thus it would potentially get significantly brighter in the next many 100 million years.

- **JADES-GS-z14-1** - It is smaller with a mass equal to about 100 million sun-sized stars, measures roughly 1,000 light years across and forms about 2 new stars per year.

JADES Program

- **JADES** - JWST Advanced Deep Extragalactic Survey.
- **Partnership** - An international collaboration of more than 80 astronomers from 10 countries.
- It is conducting an ambitious program of deep infrared imaging and multi-object spectroscopy.
- **Technique** - It uses 3 JWST instruments, in the 2 most famous deep fields on the sky
 - The Hubble Deep Field (GOODS-N)

- The Hubble Ultra Deep Field (GOODS-S)
- **3 scientific instruments**
 - **NIRCam** - Near-Infrared Camera
 - **NIRSpec** - Near-Infrared Spectrograph
 - **MIRI** - Mid-Infrared Instrument

North Korea's Spy Satellite

Malligyong-1-1 satellite launch failed as the rocket exploded and fell into the Yellow Sea shortly after lift-off.

- It is a ***military reconnaissance satellite***.
- **Launched by** - *North Korea*.
- **Russia's assistance** - Russian experts have visited North Korea to help with the satellite and space rocket program.

***Malligyong-1 satellite** which was launched successfully in 2023 is North Korea's 1st spy satellite.*

- **Reason for failure** - One of the main issue is due to the failure of newly developed *liquid-fuel rocket motor*, which is the 1st stage.
- It uses a combination of ***liquid oxygen and petroleum engine***.
- **Challenges** - Liquid oxygen engines require specialised storage and handling due to extremely *low boiling points (-183 degree Celsius)*.
- It is quite difficult to solve combustion instability problems of this fuel system and apply materials and parts that can withstand extremely low temperatures.

*North Korea's **Chollima-1 satellite** uses hypergolic fuels, substances that can be stored at room temperature but ignite on contact each other, thus require careful handling. It is used in nuclear ballistic missiles.*

***Hypergolic fuels** include hydrazine (N₂H₄) and its derivatives including: monomethylhydrazine (MMH), unsymmetrical dimethylhydrazine (UDMH), and Aerozine 50 (A-50).*

- **Significance** - Using different engines might allow North Korea to differentiate its civilian space program from its missile program, which is banned by the UN Security

Council.

Yellow Sea

- It is a large *inlet of the western Pacific Ocean*.
- **Yellow colour** - It was named so as the yellowish sand particles originating from the Gobi Desert that descend on the surface of the sea, thereby giving it a golden yellow colour.
- Also known as *Huang Hai or Hwanghae*.
- **Location** - It is lying between mainland China on the west and north, the Korean peninsula on the east and the Shandong Peninsula & Liaodong Peninsula to the south.
- **Boundaries** - It is to the north of the *East China Sea* while the *Bo Hai Sea* is the north-western extension of the Yellow Sea.
- It is dotted with numerous islands, some of which are
 - Jeju Island (South Korea), Shandong Peninsula islands (China), and Ganghwa Island (South Korea).

Spot-bellied Eagle Owl

Pench Tiger Reserve reports first photographic record of forest eagle owl.

- **Scientific Name** - Bubo Nipalensis.
- **About** - It is a large, bold, nocturnal species of owl known for their distinctive spots on their belly. It is also known as ***forest eagle owl***.
- **Habitat** - It is found in dense evergreen and moist deciduous forest usually near water, mostly observed in Arjun and Banyan trees.
- **Distribution**
 - **In world** - Bhutan, Cambodia, China, India, Laos, Myanmar, Nepal, Sri Lanka, Thailand, and Vietnam.
 - **In India** - Foothills of Uttarakhand to North-eastern India, Gujarat, Western and Eastern Ghats.

These birds have also been reported from Madhya Pradesh and Kanha Tiger Reserve.

- **Calls** - Their call is a low, deep ***double hoot*** lasting 2 seconds. They make calls to communicate across long distances, territorial defence, and attracting mates.
- **Prey** - It is an ***apex predator***, feeding on a variety of prey including large birds, rodents, small mammals, reptiles, and insects. It occasionally hunt on day.
- **Conservation Status**
 - **IUCN** - Least concern
 - **CITES** - Appendix II
 - **WPA** - Schedule IV

Pench Tiger Reserve

- Pench Tiger Reserve is located in satpura hills of ***Madhya Pradesh***.
- It is the ***19th Tiger Reserve*** of the country, comprises of the Indira Priyadarshini Pench National Park, the Pench Mowgli Sanctuary.
- It derives its name from the River Pench which splitting the Park into two, while forming the boundary of Seoni and Chhindwara districts.
- The ***Meghdoot dam*** built across ***Pench River***.

LignoSat wooden satellite

Recently scientists have developed the satellite named LignoSat.

- It is **world's 1st wooden satellite**.
- **Developed by** - **Japan**, a collaboration between Kyoto University and the logging company Sumitomo Forestry.
- **Aim** - To test the idea of using wood as an *eco-friendly alternative to metal based satellites* as wood would burn completely upon re-entry into Earth's atmosphere.
- To measure the deformation of the wooden structure in space.
- **Size** - It is a cube that measures *10 centimetres* on each side.
- **Material** - A timber from *magnolia wood*.

Magnolia wood is a highly sought-after timber, known for its striking colouration and fine grain.

- **Significance** - It was founded to be *particularly stable and resistant to cracking* in laboratory tests.
- There is no oxygen in space which could cause wood to burn, and no living creatures to cause it to rot.
- **Future prospects** - If the LignoSat succeeds in orbit, wood could become a material for future satellites.
 - Over *2,000 spacecraft expected to launch annually*.

Issues with Satellites made of Metals

- **Creates space debris** - All the metal based satellites which re-enter the Earth's atmosphere burn and create tiny alumina particles, which will float in the upper atmosphere.
- **Threat to satellites and spacecraft** - Metals particles can damage the space observatory instruments.
- **Depletes the ozone layer** - Ozone layer protects us from harmful UV radiations from the Sun.
- **Alters the amount of sunlight** - It travels through the atmosphere and reaches the ground.

Currently, more than 27,000 tracked pieces of space debris orbit Earth at speeds of approximately 15,700 mph in low Earth orbit.

Virus-like Particles (VLPs)

Scientists had recently developed a novel method to generate non-infectious virus-like particles (VLPs) that mimic the Nipah virus (NiV).

- **Nipah Virus** - Nipah virus (NiV) is a zoonotic disease that spreads primarily between animals and humans.
- Nipah is a highly pathogenic paramyxovirus, with a fatality rate of up to 80% in affected humans.
- The genome of the NiV encodes 6 major proteins:
 - Glycoprotein (G)
 - Fusion protein (F)
 - Matrix (M)
 - Nucleocapsid (N)
 - Long polymerase (L)
 - Phosphoprotein (P)
- **Virus-like Particles (VLPs)** - VLPs are molecules that closely resemble viruses, but are non-infectious because they contain ***no viral genetic material***.
- **Characteristics** - VLPs carry most of the characteristics of the virus, except their ability to replicate (because it lacks the viral genome).
- The advent of NanoBiT technology and “HiBiT-tagged” VLP (HiBiT is an 11 amino acid peptide) makes it far more sophisticated.
- Scientists at the Institute of Advanced Virology (IAV) have generated “HiBiT-tagged” Nipah virus-like particles (NiV-VLPs).
- Highly sensitive and quantitative HiBiT-tagged Nipah virus-like particles is a platform for rapid antibody neutralisation studies.
- It was generated using plasmid-based expression systems, encoding the NiV structural proteins G, F, and M.
- The VLPs produced are morphologically and functionally identical to the native virus.
- The inclusion of a highly sensitive HiBiT tag on these VLPs accelerates their potential in antiviral drug screening and vaccine development.
- **Virus neutralisation assays** - These are critical for the development and evaluation of vaccines and immune-therapeutics,
- They are also used for conducting basic research into the immune response and pathogenesis of NiV.
- These tests, which traditionally require to be done in high security labs (BSL-4) with the infectious organism, can now be done safely in BSL-2 labs in the country using the NiV-VLPs.
- Biosafety level 4 (BSL-4) laboratories are designed to handle pathogens that are highly contagious and can cause fatal diseases.
- These pathogens are known as Risk Group 4 pathogens and include viruses like Ebola, Lassa, Nipah, Marburg and Crimean-Congo hemorrhagic fever.
