BIMSTEC

Recently, India hosted the 2nd Bay of Bengal Initiative for Multi-sectoral Technical and Economic Cooperation (BIMSTEC) foreign ministers' meeting in Delhi.

- **BIMSTEC** It is a *regional organization*, established in <u>1997</u> with the signing of the <u>Bangkok Declaration</u>.
- It is initially known as BIST-EC (Bangladesh-India-Sri Lanka-Thailand Economic Cooperation), now known as BIMSTEC.
- Headquarters Dhaka, Bangladesh.
- **Members** -It comprises **7 Member States** from South and Southeast Asia lying in the littoral and adjacent areas of the **Bay of Bengal**.
- 7 members
 - South Asia India, Sri Lanka, Bangladesh, Nepal and Bhutan.
 - **Southeast Asia -** Myanmar and Thailand.

Objectives

- Promote mutual assistance in economic, social, technical, and scientific fields.
- Provide training and research facilities in education and technical spheres.
- \circ Collaborate to combat terrorism, organized crimes, and address disasters and diseases.
- Maintain cooperation with similar international and regional organizations.
- Strive to eradicate poverty in the region.
- Promote trade and investment to foster regional development.

• BIMSTEC Centres

- BIMSTEC Energy Centre
- BIMSTEC Centre on Weather and Climate

BIMSTEC houses 1.73 billion people and having a combined gross domestic product of US\$5.2 trillion (2023).

Vaccine for Shigella

The Indian Council of Medical Research (ICMR) has recently found an Indian partner to manufacture the breakthrough vaccine for the Shigella infection.

- Shigella It is an <u>intestinal infection</u> caused by <u>bacterium</u> that belongs to the <u>enterobacter family</u>.
- Four species of Shigella
 - Shigella sonnei
 - Shigella flexneri
 - Shigella boydii
 - Shigella dysenteriae
- The main sign of shigella infection is *diarrhea*, which often is bloody.
- **Symptoms** Diarrhea (often containing blood or mucus), Stomach pain or cramps, Fever, Nausea or vomiting.
- Some people have *no symptoms* after they've been infected with shigella but their feces may still be contagious up to a few weeks.
- Transmission Shigella is very contagious.
- People get infected with shigella when they come in contact with and swallow small amounts of bacteria from the stool of a person who is infected with shigella.
- Eating or drinking *contaminated food or water*.
- It can also be spread during **sexual activity** with a sick person.
- Vulnerable Age <u>Children under age 5</u> are most likely to get shigella infection, but it can occur at any age.

Shigellosis affects about 188 million cases per year that result in about 1 million deaths per year around the world.

- **Prevention** Washing your hands frequently with soap and water is key to preventing the spread of this infection.
- Vaccine There is no vaccine or cure yet.

Mineral nano particles

Recently, IIT-Madras team makes mineral nanoparticles with water.

- **Background** Water droplets are *ubiquitous* in our environment which exist in various sizes from large raindrops to minute aerosol particles.
- Among these, *microdroplets*, which are a thousandth the size of typical raindrops, display unique properties and behaviors.

- Surface Molecules vs. Bulk Molecules In bulk water, surface molecules participate in chemical reactions more readily than those inside.
- Microdroplets, due to their <u>confined space and close-packed molecules</u>, engage in chemical reactions more eagerly and up to a <u>million times faster than bulk water</u>.
- **Electrically Charged Microdroplets** Microdroplets at the beach can *carry ions from seawater*, settling on skin.
- As larger droplets evaporate and shrink, remaining water molecules bond closer, potentially leading to the formation of <u>negatively charged hydroxyl ions (OH-) and</u> <u>free protons (H+)</u>.
- Research Findings on Microdroplets The team conducted an experiment using quartz, ruby, and fused alumina crystals.
- Applying a *high voltage* to mineral microparticles in water, they observed the particles breaking into nanoparticles within milliseconds.
- Free protons might infiltrate crystal layers and break them apart.
- Surface tension and electric fields could contribute to *creating shockwaves* that fragment the microdroplets.
- Implications of the Study
- **Origins of Life** The study's findings could aid research on proto-cells, potential precursors to modern cells, providing insights into the origins of life.
- **Agricultural Applications** Silica nanoparticles, essential for plant growth, can be supplied to soil, improving agricultural productivity.
- ullet This method could $\underline{\textit{transform unproductive soils}}$ and desertified areas into fertile lands.

Nanoparticles

- Nanoparticles They are tiny particles that measure between <u>1 and 100</u> nanometers in size.
- A nanometer is **one-billionth of a meter**, making nanoparticles incredibly small, often comparable in size to atoms and molecules.
- **Property** Due to their small size, nanoparticles have a <u>large surface</u> area relative to their volume.
- This enhances their *chemical reactivity and physical properties*.
- **Applications** Medicine, Electronics, Energy, Environmental, Materials Science.

Uropeltis caudomaculata

A team of researchers have recently discovered a new species of shieldtail snake in the Meghamalai-Munnar hill region of the Western Ghats.

- **Shieldtail snakes** These are a *non-venomous*, small, and fascinating group of *burrowing snakes* with over 50 species identified from the Western Ghats.
- Shield-tail snakes belong to the Uropeltidae family, endemic to peninsular India and

Sri Lanka.

- They have a *large keratinous shield* at the tip of the tail and hence called shield tailed snakes.
- Habitat Inhabit Hilly forests, occupy tunnels in the leaves, humus, rocks & logs.

Uropeltis caudomaculata

- It is a shieldtail snake recently found in Western Ghats have similarities with its closest known relative, Uropeltis pulneyensis.
- The name, Uropeltis caudomaculata, refers to the lateral yellow spot on each side of the base of the tail.

- Endemic Uropeltis caudomaculata is known to be found in only 3 localities
 - Meghamalai Tiger Reserve in Tamil Nadu
 - Periyar Tiger Reserve
 - Yellapetty, Munnar in Kerala.
- **Breeding** These snakes spend most of their life *underground* and emerge during the *monsoons* for breeding.
- Diet They feed on earthworms and other small snakes.

Ouick facts

- Sky island habitats These are separated from each other <u>physically and</u>
 <u>environmentally</u> but have similar communities of species distinct from those elsewhere in the Western Ghats.
- In the Western Ghats, the <u>shola grassland forests of the Agasthyamalai region</u>, <u>Meghamalai, Anamalais, Nilgiris, and Wayanad</u> are some of the important sky islands with rich and unique biodiversity.
- The fragile sky islands are highly threatened by the rapid encroachment of highly invasive species such as *acacia, lantana, wattle, and pine trees*.
- **Reptiles** The Western Ghats is one of the most diverse regions for reptiles in India, with **more than 50% endemic species**.
- 15 new species of snakes have been described from the Western Ghats in the past 5 years.

Makhana Cultivation

Makhana have become a popular 'super snack', with prices rising sharply in both domestic and international markets since 2019.

- **About** Foxnuts or Makhana is an aquatic crop traditionally grown in India.
- Botanical Name- Euryale ferox.
- Common Names- Fox nut, Gorgon nut, Phool Makhana.
- **Production-** Makhana, is mainly cultivated in the states of **Bihar**, **West Bengal and Assam**.

Bihar is the leading producer of makhana accounting for more than 90% of the total production of India. India contributes to 80% of the world's demand.

- Climate- Makhana is an aquatic crop and requires a warm, humid climate. It is typically cultivated in areas with temperatures ranging from 20°C to 35°C.
- **Soil-** It thrives in loamy and clayey soils with good water *retention capacity*. The pH of the soil should be between 5.5 to 7.5.
- Nursery Preparation- Seeds are collected from mature Makhana fruits.
 - Seeds are soaked in water for 24-48 hours before sowing.
 - Seeds are sown in nursery beds or trays filled with a mixture of soil and cow dung.
- Main Field Preparation- Select low-lying areas or water bodies like <u>ponds</u>, <u>lakes</u>, <u>or wetlands</u>.
 - **Transplanting-** Seedlings are transplanted into the main field after 30-40 days when they are about 15-20 cm tall.
- **Fertilization-** Organic fertilizers like cow dung can be applied. Chemical fertilizers are generally avoided.
- **Harvesting** Makhana plants take about <u>4-5 months</u> to mature.
 - The seeds are harvested when the fruits start to crack and the seeds float on the water surface.
- **Nutritional value-** The crop is a good source of vegetarian **protein**, at 10%, and contains five of the **nine amino acids**.
- There are also *quercetin and kaempferol flavonoids*, both of which protect against diabetes and obesity.
- It is considered a 'super snack' because they are low in calories, rich in protein, and contain essential nutrients.
- **Makhana Development Scheme-** The Bihar government runs the Makhana Development Scheme that gives a <u>75% subsidy</u> on the Suvarna Vaidehi variety of seeds, calculated at ₹97,000 per hectare.
- Makhana is approved under the Union government's <u>One District One Product</u>
 <u>scheme</u>, which provides subsidies to food processors for branding, marketing, and
 infrastructure development.
