

## US Corporate Tax Reform

### Why in news?

\n\n

US is likely to enact a new corporate tax reform.

\n\n

### What is the present US corporate taxation rule?

\n\n

\n

- The current US rule is unique among all major advanced economies.

\n

- For instance a subsidiary of a US corporation that earns profits in Ireland and it pays the Irish corporate tax at 12 per cent rate.

\n

- It is then free to reinvest the after-tax profits in Ireland, in financial securities, or in operating businesses anywhere in the world except the US.

\n

- If the foreign subsidiary's parent company brings the after-tax profits back to the US, it must pay the current US corporate tax rate of 35 per cent.

\n

- The tax is collected on its original pre-tax Irish profits, with a credit for the 12 per cent that it has already paid.

\n

- US companies generally choose not to repatriate the profits of their foreign subsidiaries as there is 23 per cent penalty on repatriation.

\n

\n\n

### What is US new tax reform?

\n\n

\n

- US is likely to adopt the "territorial" method of taxing the profits of US

corporations' foreign subsidiaries.

\n

- This will reduce the present a 35 per cent statutory tax rate on corporate profits to 15- 20 per cent.

\n

- Under the territorial method, US corporations will be able to repatriate their foreign subsidiaries' after-tax profits with little or no extra tax.

\n

- It is also likely to enact a "deemed repatriation tax" on the \$2.5 trillion of profits that have been accumulated abroad but never subject to US tax.

\n

- The basic idea of deemed repatriation tax would be to levy a tax of about 10 per cent on the untaxed overseas profits, to be paid over a period of years.

\n

- Companies in abroad will have an incentive to shift their headquarters to the US, without incurring the current tax penalty.

\n

\n\n

## **What will be the impacts of this new taxation?**

\n\n

\n

- US corporations will no longer have an incentive to shift their country of incorporation to other countries.

\n

- A large share of foreign subsidiaries' profits in abroad is likely to be returned to the US, reducing investment in Europe and Asia.

\n

- A portion of the \$2.5 trillion of past profits now held abroad would be repatriated as well.

\n

- This would raise US productivity and GDP, leading to increases in tax revenue that would partly offset the direct effect of the corporate rate reduction.

\n

- The reduction of the US rate will cause other developed countries to reduce their corporate tax rates to improve their relative attractiveness to internationally mobile capital.
