

Water Management Lessons from Israel

Why in news?

 $n\n$

The Indo-Israeli partnership is likely to extend to areas like water and agriculture.

 $n\n$

What are the facts related to water?

 $n\$

\n

• India is water stressed. The country's annual **per capita availability of** water is less than 1,500 cubic meters (cu.m) and that scenario is likely to worsen.

\n

 \bullet Currently, about 78% of fresh water in India is used for agriculture. $\ensuremath{\backslash} n$

 $n\n$

\n

- Israel has per capita water availability of less than 200 cu.m.
- It is an extremely water scarce region. Yet, the country exports high-value agri-produce to Europe and many other parts of the world.
- The country is known for innovations in water management be it drip irrigation, recycling of urban wastewater for use in agriculture or desalinisation of seawater for drinking purposes.

 $n\n$

How water is governed in Israel?

 $n\$

۱n

 As per Israel's water law, all water in the country is common property resource.

\n

• The government does **accounting for every drop of water**, ensuring good water governance.

۱n

• As a result, in 2013, of the total water available in Israel almost 16% came from desalinating seawater and another 22% came from recycling wastewater.

۱n

 Almost 62% of the irrigation water used in Israel comes from recycled and brackish water, thus saving potable water for domestic use.

 $n\n$

Whether the micro-irrigation concepts are new to India?

 $n\$

\n

 Micro-irrigation technologies such as drip irrigation and sprinklers are not new to India.

\n

- India has about nine million hectares under micro-irrigation.
- It can scale this up several times. But it needs to do so quickly.
- Israel can offer lessons to India in this respect.
- Any scaling up of technologies needs the right policy environment.
- Water is not a free good. It needs to be priced to reflect its scarcity.
- Such recycling endeavours with proper treatment that make wastewater safe have relevance in India.

\n

India does have the technology for this purpose.

 $n\n$

Where else India can cooperate with Israel?

 $n\n$

\n

- Another area of potential cooperation is cleaning polluted rivers.
- As per government reports, between 2009 and 2015, the number of polluted rivers and river stretches in India has almost doubled.

\n

- Almost 63% of the total sewage generated in the country is discharged into water bodies without any treatment resulting in acute river pollution.
- Recently, the Delhi Government has roped in the Israeli firm to clean up an eight km stretch of the Yamuna.

 $n\n$

What is the way ahead?

 $n\n$

\n

 India needs an integrated approach to solving India's emerging water crisis, involving different kind of interactions between Indians and Israeli agencies.
