

Water Stress in India

What is the issue?

\n\n

\n

- The NITI Aayog's water management index was released recently. Click [here](#) to know more.

\n

- This, along with a NABARD sponsored study on water productivity of different crops depicts the country's increasing water stress.

\n

\n\n

What are the highlights of NITI Aayog's report?

\n\n

\n

- The current water crisis in the country is said to be the worst in history.

\n

- NITI Aayog maintains that about 600 million people face high to extreme water scarcity.

\n

- This is almost half the population of the country.

\n

- About 200,000 people die every year due to lack of safe water.

\n

- The crisis will escalate with the water availability dwindling to merely half of the effective demand by 2030.

\n

- Groundwater resources (40% of total water supply) are also predicted to deplete rapidly.

\n

- This may accentuate water paucity in both rural and urban areas.

\n

- Some 21 cities, including Delhi, Bengaluru and Hyderabad, will almost run out of groundwater by as soon as 2020.

\n

- If these come true, around 40% of the population will lose access to water.

\n

- Also, the gross domestic product (GDP) will take a hit of about 6%.

\n

\n\n

What does NABARD's study reveal?

\n\n

\n

- It holds the overuse of water in the agricultural sector responsible for the present adversity.

\n

- Over two-thirds of the nation's available water is consumed in the farm sector.

\n

- In this, about 80% goes just to three crops — rice, wheat and sugarcane.

\n

- The most intensive cultivation of these water-guzzling crops is high in water-stressed regions.

\n

- E.g. sugarcane in Maharashtra, rice and wheat in Punjab and Haryana.

\n

\n\n

\n

- The report attributes the water crisis to unsustainable cropping trends.

\n

- This in turn is attributed to ill-advised incentives

\n

\n\n

\n

- i. liberally determined minimum support prices

\n

- ii. assured marketing through open-ended procurement

\n

- iii. subsidised or free supply of water and power

\n

\n\n

What are the possible solutions?

\n\n

\n

- The largely academic suggestions mooted in these reports to remedy the

situation include the following:

\n

- Effective pricing for water and power.
- \n
- Greater marketing support for water-efficient crops in water-constrained areas.
- \n
- A general shift from price support to cash transfer to let the actual crop prices to be determined by market forces.
- \n
- Dis-incentivising the cultivation of water-intensive crops in states like Maharashtra, Punjab and Haryana.
- \n
- Shifting these crops to water-rich eastern and north-eastern regions.
- \n

\n\n

What is the way forward?

\n\n

\n

- It is to be noted that present water crisis is largely man-made.
- \n
- India is not an inherently water-starved country.
- \n
- It receives annually about 2,600 billion cubic metres (BCM) of water through rain and snow.
- \n
- However, only around 258 BCM (or less than a tenth) can potentially be stored in available water reservoirs.
- \n
- Measures such as rainwater harvesting to conserve water have to be taken.
- \n
- The efficient use of water in farming through micro-irrigation should be ensured.
- \n
- This would be more sustainable than changing the cropping patterns in order to withstand the water crisis.
- \n
