

Weakening Rupee

Why in new?

 $n\n$

Rupee crashed to a lifetime low of 69 against US Dollar.

 $n\n$

How is the rupee trend?

 $n\n$

\n

• Rupee was pushed to a life-time intraday low of 69.10 a dollar.

- The rupee is the worst-performing currency in Asia this year.
- It has lost almost 8% in value since January 2018.
- The rupee's previous historic low was in November 2016 (it plunged to 68.86).

\n

- It is, however, not the only currency to be in the weakening trend. $\ ^{n}$
- Emerging market currencies as a group have witnessed a sharp correction in their value against the dollar this year.

 $n\n$

What are the causes?

 $n\n$

۱n

- The rise in global trade tensions amidst the ongoing **trade war** is another factor.

\n

- But its impact on the rupee remains unclear as of now.
- But by far the most important reason is the tightening of U.S. monetary policy.

\n

 Investors attracted by higher yields in the US have been pulling their capital out of India.

\n

 $n\n$

\n

• Also, **China** has been **depreciating** its currency (yuan).

r

- This is to offset the effect of duties imposed by the US.
- The Indian unit also seems to be moving in tandem with the yuan so that exporters don't lose out.

\n

 $n\n$

What will the implications be?

 $n\$

۱'n

 \bullet CAD -India's CAD jumped to 1.9% of GDP in the fourth quarter of 2017-18 from just 0.6% a year earlier.

\n

• It is now expected to widen to 2.5% in FY 2019.

\n

• This could impact the rupee as the demand for dollars could turn out to be overwhelming.

\n

• But although current account deficit has widened, it remains modest relative to GDP.

۱'n

 Also, it is largely financed by equity inflows, including foreign direct investment.

\n

• External risks - Moody's Investors Service has ruled out any risk with this development.

\n

• India's large and relatively stable domestic financing base restricts its external vulnerability.

\n

- It will contribute to the economy's resilience by protecting from abrupt changes in external financing conditions.
- **Debt Affordability** Currency depreciation transmitting into materially weaker debt affordability is limited.

\n

• This is because of India's low dependence on foreign-currency borrowing to fund its debt burden.

\n

• India's significant build-up of foreign exchange reserves in recent years to all-time highs provides a support buffer.

۱n

 \bullet This will contribute to mitigating the external vulnerability risk. $\mbox{\ensuremath{\backslash}} n$

 $n\n$

How does the future look?

 $n\n$

\n

- \bullet The tightening of monetary policy by the U.S. Federal Reserve has traditionally caused impact on the global credit cycle. $\mbox{\sc has}$
- It is hard to determine if the worst is over yet for emerging market currencies.

\n

• But the American central bank expects to raise interest rates further this year.

\n

- \bullet It suggests that there could possibly be more ramifications in the economy. $\ensuremath{\backslash n}$
- \bullet The government, as well as the RBI, recently raised domestic interest rates. $\ensuremath{^{\backslash n}}$
- This was in response to the rising external economic risks.
- \bullet There is a need for reassessing the policy of altering domestic rates in response to the US Fed rates. $\mbox{\sc h}$
