

## World Air Quality Report 2018

### Why in news?

'IQAir AirVisual 2018 World Air Quality Report' was recently published by NGO Greenpeace and IQ Air Visual.

### What are the highlights?

- The report was a compilation of air quality data from public and private monitoring sources.
- It asserted that 7 of the world's top 10 cities with the worst air quality in 2018 are in India.
- 15 of the 20 cities worldwide ranked the worst on air pollution metrics are in India.
- Gurugram, which borders Delhi, was identified as the city with the worst air quality in the world in 2018.
- It has an annual average concentration of pollutant PM 2.5 at 135.8 micrograms per cubic meter (ug/m<sup>3</sup>).
- It is however an improvement as compared to 145.6 ug/m<sup>3</sup> in 2017 in Gurugram.
- Gurugram was followed by Ghaziabad at the second position with an annual average concentration of 135.2 ug/m<sup>3</sup> in 2018.
- The position for number four was held by Faridabad, followed by Bhiwadi and Noida.
- Noida at position six on the list was succeeded by Patna followed by Lucknow with an annual average concentration of 115.7 ug/m<sup>3</sup>.
- Delhi continues to be extremely hazardous city to live in, with annual average fine particulate matter (PM<sub>2.5</sub>) of 113.5 ug/m<sup>3</sup>.
- **Permissible limits** - The National Ambient Air Quality Standards define the permissible limit for the concentration of PM 2.5 at 40 ug/m<sup>3</sup>.
- On the other hand, the World Health Organisation (WHO) defines the same at 10 ug/m<sup>3</sup>.

Rank	City	2017 AVG	2018 AVG
1	 Gurugram, India	145.6	135.8
2	 Ghaziabad, India	144.6	135.2
3	 Faisalabad, Pakistan	-	130.4
4	 Faridabad, India	123	129.1
5	 Bhiwadi, India	-	125.4
6	 Noida, India	134	123.6
7	 Patna, India	118.5	119.7
8	 Hotan, China	91.9	116
9	 Lucknow, India	119.2	115.7
10	 Lahore, Pakistan	133.2	114.9

### What do other insights show?

- The Ministry of Heavy Industries and Public Enterprises commissioned a study recently on the factors of pollution in Delhi.
- In Delhi, dusty sources such as roads, construction sites and bare soil add about 42% of the coarse particulate matter (PM10) in summer, and 31% in winter.
- Similarly, PM10 from transport varied between 15% and 18% across seasons.
- Vehicles contribute 18-23% of PM2.5 which is a more unhealthy particulate that penetrates the lungs.
- Biomass burning was estimated to make up 15-22% and dusty sources 34% of PM2.5 during summer.
- These insights provide a road map for action; the Delhi government has done well to decide on inducting 1,000 electric buses.

### What are the shortfalls?

- Despite multiple reports putting air quality standards across India at 'hazardous' levels, little or nothing is being done either by the centre or the states.
- The monitoring of air quality in real time across cities and towns in India is

far from adequate or uniform.

- The National Clean Air Programme was recently launched for 102 cities and towns, including the capital.
- It talks only of long-term benefits of air pollution mitigation programmes beyond 2024, and not a dramatic reduction in near-term pollution.

### **What should be done?**

- An annual target for reduction has to be set to make governments accountable.
- Achieving this requires the political will to reform key sectors such as the transport, biomass and construction.
- A transition to electric vehicles for all commercial applications, with funding from the Centre's programme for adoption of EVs should be a priority in cities.
- Cutting nitrogen and sulphur emissions from industrial processes needs a time-bound programme supervised by the Environment Ministry.
- It is crucial at this point to ensure that India's future generations are not confined to cities which double up as gas chambers.
