

Q. Project Sampoocha's success in reducing child malnutrition is a model that can be easily implemented anywhere in the country. Discuss (200 words).

Ans.

Project Sampoocha is designed to reduce the maternal mortality rate and infant mortality rate of the Bongaigaon district targeting mothers of malnourished children.

PM Modi also had identified health and nutrition as priority areas and reiterated the need for a Kuposhan Mukt Bharat and Poshan Abhiyan in 2017-18 but still we were 101 place in GHI due to insufficient administration.

Benefit of this project or model :-

(1) How it works :- It can easily be applicable in India because it is connected to the community or local community which is not burdensome for ex. It can be using 'butty moment' means

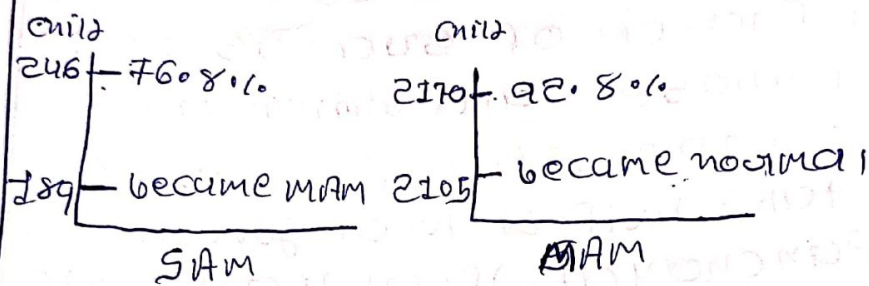

one mother who ~~is~~ ^{have} knowledge for nutrition and his child is healthy ~~link~~ this mother with unhealthy or malnourished child so they can work in pair.

(2) real time data :- It work on real time data so there is high chance of success rather than those data which are old or unuseful. For this we can take help of local government ex. Panchayat, local leader etc. collecting data.

(3) encouraged mother :- It's not only about child health but as well about financial condition of family. So women depended on male family members and have no source of income so this Project link them to National Livelihoods Mission by end of year 90% of women joined became independent.

result :- they did this project for three months by end of the three month. out of 2,170 malnutrition child 2,115 became normal.

SAM :- (Severe Acute malnutrition)
MAM :- (Moderate Acute malnutrition)

Conclusion :-

we already does Anganwadi -di, SHG, NRLM, etc. government scheme. and this project work on zero economic investment if government implement this project with PosHAN project we definitely change our many an GHI and livelihood of our people.
